## Important Notes - read me first

### Version control

- Always check that you have the most recent version of this document, which - unless I am sending you unfinalized work - is available [here](#).
  - An easy check for version control is to make sure this date: 2026-01-11. is the same as on the GitHub file [here](#).
- The code for this is analysis available in the same repository ([targets master file here](#) and [individual functions here](#))

### Regarding the use of site & race/ethnicity

- Some MESA field centers did not collect data on individuals from select race / ethnicity groups (see: Table 1). Therefore, only race/ethnicity was included in analyses, with the exception of sample descriptives.

## Summary

### Step 1: Cleaning and Formatting Proteins

#### Input file names

- A table of protein abundances: SMP\_IntensityNormalized\_20251005.csv

- Sample information to link TOPMed IDs to unique MESA SHARe ID and exam combinations: Mapping\_SMP\_Plate\_20251005.csv
- Keys to link Olink IDs to names compounds: MESAlink3k\_proteinKeys\_03292023.csv
- A file to bridge SHARe ids (sidno) with MESA IDs (idno) MESA-SHARe\_IDList\_Labelled.csv

## Raw file info

- The raw protein abundance file contained information on N=3040 protein assays, including those used for QC.
- When removing assays for QC, the raw protein abundance file contained information on N=2941 proteins.
- The protein abundance file contained information on N=14051 sample IDs (i.e., unique participant/exam combinations), including bridging samples.
- After removing QC samples (including bridging, controls, and one duplicate) the protein abundance file contained information on N=12739 sample IDs (i.e., unique participant/exam combinations).

## Formatting

- Bridging (and other QC) samples were removed.
- Protein assays used for QC were removed.
- Proteins that should be excluded due to QC warnings (variable “QC\_warning” set to “EXCLUDED”) were removed, even though these do not have NPX values.
- Data were put into wide format, with “SampleID” as the unique ID, “OlinkID” forming the variable names (protein identifiers), and values taken from the “NPX” column.
  - In wide format, the file contained information on N=12739 unique sample IDs.
  - In wide format, the file contained information on N=0 duplicated sample IDs. <sup>1</sup>
- SHARe IDs, and subsequently MESA IDs, were merged into the file with exam information.
- At this point, the range of unique SHARe ID by exam combinations was N=0 - 1. This indicates no sample ID were duplicated in the assays.
- The formatted protein file was used to calculate the coefficient of variation (CV) using the formula:  $CV = \sqrt{2^{(\sigma^2 - 1)}}$ .

Table 2: Final N by exam

Exam	N_Pps
1	5949
5	3917
6	2873

- A variable called “Retain” was created to indicate whether each protein was (1) unique (i.e., included on only one panel); (2) duplicated, and across all panels had the lowest CV; or (3) duplicated, and across all panels did not have the lowest CV.
- A final table of protein abundances, with additional variables for SHARe ID, MESA ID, Exam, TOPMed ID and Batch, was created after the steps above, with proteins duplicated across more than one panel cleaned such that only the one with the lowest CV is retained. This file was used in the analysis
- The number of participants, stratified by exam, in the final file is available in [Table 2](#):

## Step 2: Format Phenotypes

### Input files

- Covariates from E1: MESAe1FinalLabel02092016.dta
- Covariates from E5: MESAe5\_FinalLabel\_20140613.dta
- Covariates from E6: MESAe6\_FinalLabel\_20220513.dta
- Afib info: SHARE\_MesaEventsThruYear2020\_AF\_DS.txt
- ApoE info: MESA\_ApoE\_03102014.sas7bdat
- Incident CVD: MESAeVThru2020AllCohort\_20241120.dta
- Microbleeds: MESAe6as253as301\_BMRICMB\_08052025.csv
- Perivascular spaces: MESAe6as253as301\_BMRIPVS\_20250310.csv
- White matter hyperintensities: MESAe6anyFIRST\_BMRIWMHVol\_20240422.csv
- Intracranial volumes: SHARE\_AncilMesaAF\_BMRIROIIVol\_DS.txt
- Fractional anisotropy: mesae6anyfirst\_bmriTotalFAMUSE\_20250828.csv
- White matter hyperintensities: MESAe6anyFIRST\_BMRIWMHVol\_20240422.csv

### Formatting

#### Outcomes:

- Microbleeds were coded as 0/1, where 0= no microbleeds (value: 0) and 1 = presence of microbleeds (all non-zero values except missing). Then, those images with a low image quality (value = 4; N=0 ) were recoded to missing.
- Perivascular spaces (variable: epvs\_wholebrain\_vol) were recoded to missing where the variable 'pvs\_exclude' was coded as 1 (N=0).
- White matter hyperintensities (variable: wm\_wmh) were divided by 1000 to convert to ml (following Rizwan's code), and those where the variable wmh\_exclude had a code of 1 were set to missing.
- Fractional anisotropy (variable: wmfa) was coded to missing where the variable fa\_exclude had a value of 1.

## Covariates

### True time invariant covariates

- Race/ethnicity, gender, and highest education level were all taken from exam 1 data. ApoE information was taken from its own dataset (above).
- ApoE was coded 0/1/2 where 0= no e4 isoform (codes 22, 23, 33), 1 = e4 isoform (24, 34, 44), and 2 = no isoform data. The ApoE variable was formatted as a factor.
- Gender was coded such that female = 0 and male = 1.
- Education was recoded 0/1, such that 0 = less than high school (codes: 0: NO SCHOOLING / 1: GRADES 1-8 / 2: GRADES: 9-11) and 1= high school or more (all other codes, excluding missing).
- Race/ethnicity was recoded retaining the original MESA coded whereby 1=White American; 2= Chinese American, 3=Black, African-American, and 4 = Hispanic. Race/ethnicity was coded as a factor variable.

### Pseudo-time invariant covariates

- Although some variables are technically time invariant, where they were included due to their effects on MRI data, since MRI data are only measured at one exam for this analysis (exam 6), these covariates were always taken from exam 6.
- These ‘pseudo time invariant covariates’ were: atrial fibrillation, myocardial infarction, congestive heart failure, LDL, systolic blood pressure, hypertension medication, and site (since site seems to affect MRI more than proteins??).
- Afib, MI, and CHF were coded 0/1, such that 0= no diagnosis and 1= afib diagnosis. Missing data was left as missing (this is different to Rizwan who coded missing data as no diagnosis).
- Site was arbitrarily coded as 0=Wake forest, 1= Columbia, 2=Johns Hopkins, 3=University of Minnesota, 4=Northwestern, 5=UCLA

### Time varying covariates

- The following covariates were taken from the exam when the proteins were used, as these were seen to affect proteins more in the short term than they affect MRI (?): kidney function (egfr), BMI , cigarette smoking (never/former/current; coded as ordinal), diabetes status.
- Smoking was harmonized and coded such that 0 = never smoker, 1= past smoker, 2=current smoker.

- Diabetes has harmonized and coded such that 0= no diabetes (including impaired fasting glucose), and 1 = diabetes (treated and untreated).
- The following covariates were taken from exam 6: age (age6c), kidney function (egfr; cepgfr6c), BMI (bmi6c), systolic blood pressure (sbp6c), LDL (ldl6), site(site6c), the use of hypertension medication (htnmed6c; coded 0= no, and 1= yes), cigarette smoking (cig6c), diabetes status (dm036t)

### **Missingness**

The missingness for each variable those who have at least one MRI measure can be found in [Table 3](#)

### **Step 3: Sample descriptives**

- There were N=1429 MESA participants with at least one MRI outcome after the exclusions above.
- Of those with MRI data, N=1307 participants had protein data, equating to N=1307 at exam 1, N=1281 at exam 5, and N=1284 at exam 6
- Sample descriptives are available in [Table 4](#)

Table 3: Missingness for those who have at least one MRI measure

Variable	Frequency (N)	Proportion (%)
icv	307	23.9

<sup>1</sup>Mean (SD); n / N (%)

## Step 5: Cross sectional Protein-Wide Association Studies (PWAS)

- This section includes PWAS where proteins were only used at one time point (exam 1 or exam 6), even if this was not the same time point as when the MRI data were used.
- All estimates are standardized.

### White matter hyperintensity (WMH)

#### Model Specification

- The associations between WMH and proteins were analyzed via linear regression
- For WMH the numeric covariates included icv, age, egfr, BMI, sbp, ldl. <sup>2</sup>
- For WMH the factor covariates included gender, race, edu, htnmeds, smoking, E4, AFprevalent, diabetes, MIprevalent, CHFprevalent. <sup>2</sup>
- WMH was transformed using an inverse normal transformation (with blom constant).

#### WMH: Exam 6 proteins

- The E6 proteins -> E6 MRI for WMH included data from N=933 participants.
- A total of N=0 exam 6 proteins were significantly associated with WMH at an FDR corrected  $P < .05$ .

#### WMH: Exam 1 proteins

- The E1 proteins -> E6 MRI for WMH included data from N=913 participants.
- A total of N=0 exam 1 proteins were significantly associated with WMH at an FDR corrected  $P < .05$ .

### Enlarged Perivascular Spaces (EPVS)

#### Model Specification

- The associations between EPVS and proteins were analyzed via linear regression
- For EPVS the numeric covariates included icv, age, egfr, BMI, sbp, ldl. <sup>2</sup>
- For EPVS the factor covariates included gender, race, edu, htnmeds, smoking, E4, AFprevalent, diabetes, MIprevalent, CHFprevalent. <sup>2</sup>
- EPVS was transformed using an inverse normal transformation (with blom constant).

### **EPVS: Exam 6 proteins**

- The E6 proteins -> E6 MRI for EPVS included data from N=926 participants.
- A total of N=0 exam 1 proteins were significantly associated with EPVS at an FDR corrected  $P < .05$

### **EPVS: Exam 1 proteins**

- The E1 proteins -> E6 MRI for EPVS included data from N=906 participants.
- A total of N=0 exam 1 proteins were significantly associated with EPVS at an FDR corrected  $P < .05$

## **Fractional Anisotropy (FA)**

### **Model Specification**

- The associations between FA and proteins were analyzed via linear regression
- For FA the numeric covariates included age, egfr, BMI, sbp, ldl. <sup>2</sup>
- For FA the factor covariates included gender, race, edu, htnmeds, smoking, E4, AFprevalent, diabetes, MIprevalent, CHFprevalent. <sup>2</sup>
- FA was transformed using an inverse normal transformation (with blom constant).

### **FA: Exam 6 proteins**

- The E6 proteins -> E6 MRI for FA included data from N=1170 participants.
- A total of N=2 exam 6 proteins were significantly associated with FA at an FDR corrected  $P < .05$  (see Table 5 and Figure 1).

### **FA: Exam 1 proteins**

- The E1 proteins -> E6 MRI for FA included data from N=1146 participants.
- A total of N=520 exam 1 proteins were significantly associated with FA at an FDR corrected  $P < .05$  (see Table 6 and Figure 2).

## Microbleeds (MB)

### Model Specification

- The associations between MB and proteins were analyzed via logistic regression (MB coded as 'present' vs. 'absent' as above)
- For MB the numeric covariates included age, egfr, BMI, sbp, ldl. <sup>2</sup>
- For MB the factor covariates included gender, race, edu, htnmeds, smoking, E4, AFprevalent, diabetes, MIprevalent, CHFprevalent. <sup>2</sup>

### MB: Exam 6 proteins

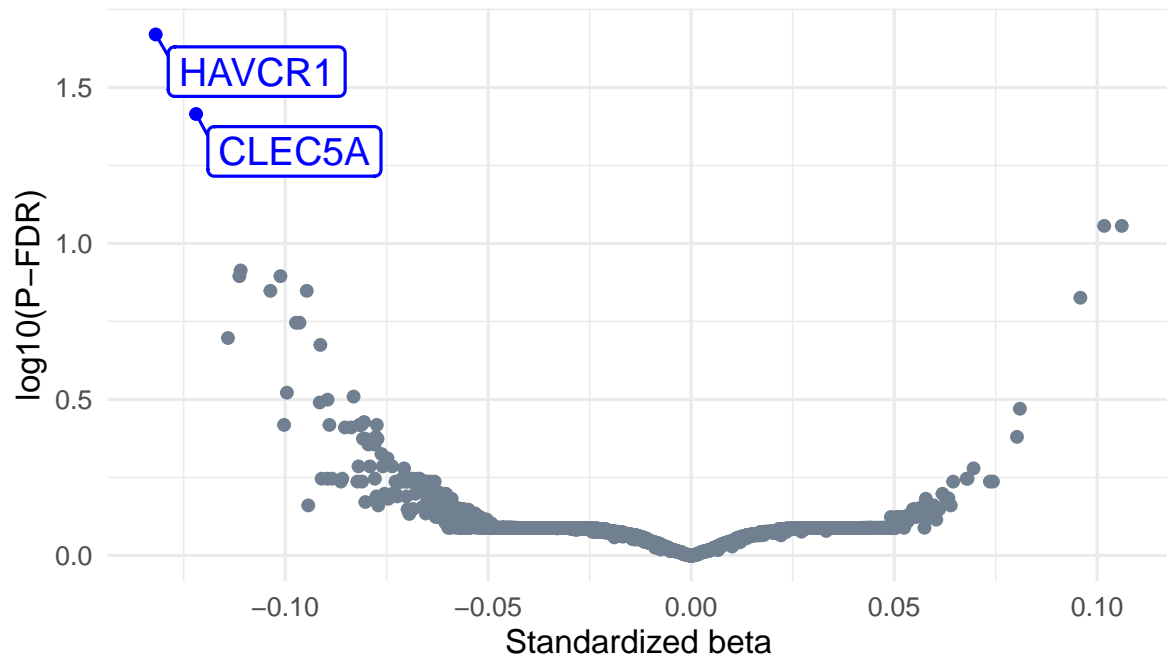

- The E6 proteins -> E6 MRI for MB included data from N= 975 participants.
- A total of N=0 exam 6 proteins were significantly associated with MB at an FDR corrected  $P < .05$ .

### MB: Exam 1 proteins

- The E1 proteins -> E6 MRI for FA included data from N=974 participants.
- A total of N=0 exam 1 proteins were significantly associated with MB at an FDR correct  $P < .05$ .

Table 5: Associations Between Exam 6 Proteins and Fractional Anisotropy Reaching an FDR-corrected  $P < .05$  Equivalent

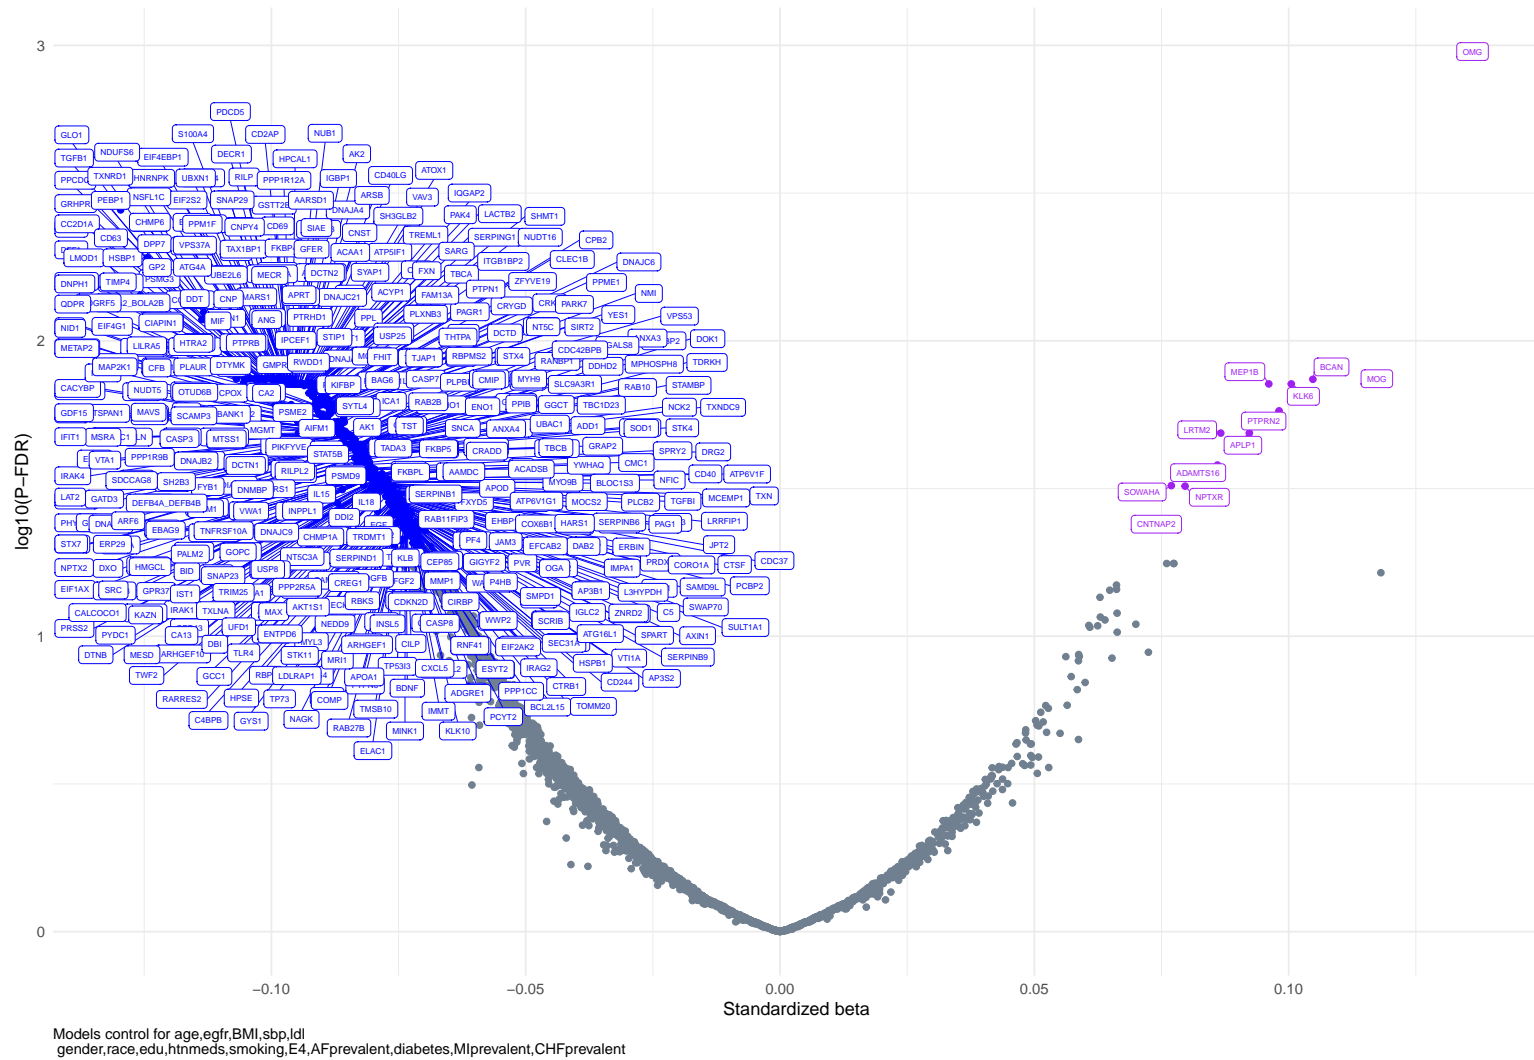

Figure 2: Associations Between Exam 1 Proteins and Fractional Anisotropy

## **Step 6: Cross sectional Protein-Wide Association Studies (PWAS) with a reduced number of covariates**

This section repeats the cross-sectional PWAS, nusing thr set of covariates recommended by Tim.

- This section includes PWAS where proteins were only used at one time point (exam 1 or exam 6), even if this was not the same time point as when the MRI data were used.
- All estimates are standardized.

### **White matter hyperintensity (WMH)**

#### **Model Specification**

- The associations between WMH and proteins were analyzed via linear regression
- For WMH the numeric covariates included icv, age, egfr, BMI. <sup>2</sup>
- For WMH the factor covariates included gender, race, edu, smoking, E4. <sup>2</sup>
- WMH was transformed using an inverse normal transformation (with blom constant).

#### **WMH: Exam 6 proteins**

- The E6 proteins -> E6 MRI for WMH included data from N=951 participants.
- A total of N=0 exam 6 proteins were significantly associated with WMH at an FDR corrected  $P < .05$ .

#### **WMH: Exam 1 proteins**

- The E1 proteins -> E6 MRI for WMH included data from N=939 participants.
- A total of N=0 exam 1 proteins were significantly associated with WMH at an FDR corrected  $P < .05$ .

## Enlarged Perivascular Spaces (EPVS)

### Model Specification

- The associations between EPVS and proteins were analyzed via linear regression
- For EPVS the numeric covariates included icv, age, egfr, BMI. <sup>2</sup>
- For EPVS the factor covariates included gender, race, edu, smoking, E4. <sup>2</sup>
- EPVS was transformed using an inverse normal transformation (with blom constant).

### EPVS: Exam 6 proteins

- The E6 proteins -> E6 MRI for EPVS included data from N=944 participants.
- A total of N=0 exam 1 proteins were significantly associated with EPVS at an FDR corrected  $P < .05$

### EPVS: Exam 1 proteins

- The E1 proteins -> E6 MRI for EPVS included data from N=906 participants.
- A total of N=0 exam 1 proteins were significantly associated with EPVS at an FDR corrected  $P < .05$

## Fractional Anisotropy (FA)

### Model Specification

- The associations between FA and proteins were analyzed via linear regression
- For FA the numeric covariates included age, egfr. <sup>2</sup>
- For FA the factor covariates included gender, race, edu, smoking, E4. <sup>2</sup>
- FA was transformed using an inverse normal transformation (with blom constant).

### FA: Exam 6 proteins

- The E6 proteins -> E6 MRI for FA included data from N=1190 participants.
- A total of N=33 exam 6 proteins were significantly associated with FA at an FDR corrected  $P < .05$ .

### **FA: Exam 1 proteins**

- The E1 proteins -> E6 MRI for FA included data from N=1187 participants.
- A total of N=628 exam 1 proteins were significantly associated with FA at an FDR corrected  $P < .05$ .

### **Microbleeds (MB)**

#### **Model Specification**

- The associations between MB and proteins were analyzed via logistic regression (MB coded as 'present' vs. 'absent' as above)
- For MB the numeric covariates included age, egfr, BMI. <sup>2</sup>
- For MB the factor covariates included gender, race, edu, smoking, E4. <sup>2</sup>

### **MB: Exam 6 proteins**

- The E6 proteins -> E6 MRI for MB included data from N= 994 participants.
- A total of N=1 exam 6 proteins were significantly associated with MB at an FDR corrected  $P < .05$ .

### **MB: Exam 1 proteins**

- The E1 proteins -> E6 MRI for FA included data from N=986 participants.
- A total of N=0 exam 1 proteins were significantly associated with MB at an FDR correct  $P < .05$ .

## **Notes**

### **Footnotes**

<sup>1</sup> This is a reproducible file for many runs, containing many data checks. Values of 0 or NULL are expected, and just indicate no problem with the data.

<sup>2</sup> These are intentionally written as variable names to avoid reproducibility errors.
